Graduation~Acceptance Rate

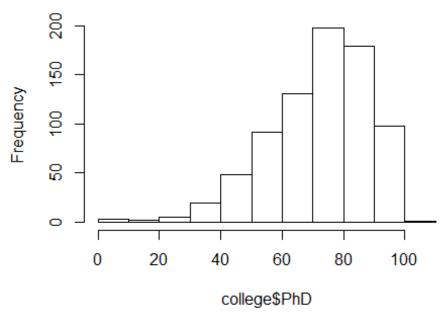

There is no statistically significant correlation between a college's acceptance rate and its rate of graduation. Though the model is not a great fit, examining the residuals gives no evidence of some higher order trend.

```

More expensive tuition is moderately to strongly negatively correlated with S.F.Ratio and moderately to strongly positively correlated with Top10perc students.

The most expensive schools are the elite, and the elite get the most able students and have the most faculty. They also have helpful PhD students which attract the best faculty and can also teach and TA.

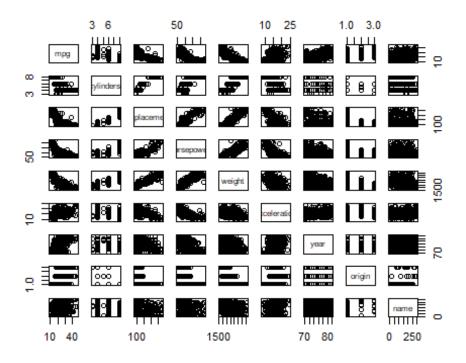

Going from the above summary statement, the college data set seems to have values that are out of range: "PhD" has a max value of 103%, Grad.Rate which is presumably also a proportion, has a max value of 118%.

```

- 1. There is a statistically significant association between MPG and displacement, weight, year, and origin.
- 2. Displacement, weight, year, and origin.
- 3. Newer cars have higher MPG: average MPG improves by 0.7508 per year. #9d

```
par(mfrow=c(2,2))
plot(auto.fit)
```

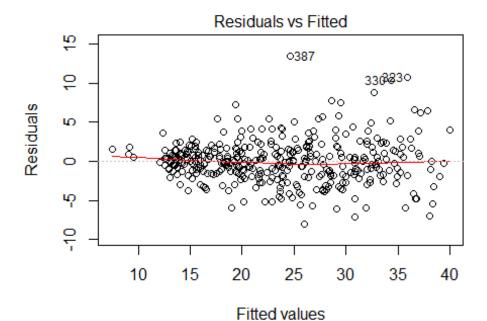

The residuals plot suggests several outliers, as does the QQ plot. The leverage plot identifies obs. 327, 394, and 14 as having high leverage. The residuals vs. fitted hints at a missing higher-order (quadratic) term.

```

norsepower ----13D -- wear --- +13D

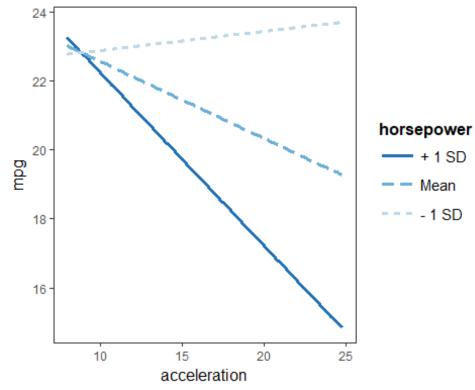

interact_plot(auto.fit2, pred = "weight", modx = "displacement")

interact_plot(auto.fit2, pred = "displacement", modx = "year")

interact_plot(auto.fit2, pred = "acceleration", modx = "horsepower")

displacement, displacement by year, acceleration by horsepower, horsepower by origin and acceleration by horsepower by origin are statistically significant interactions. Normally

Weight by

I would not try to fit so many interaction terms or even three way interactions as they are very hard to interpret; however, I wanted to take this opportunity to learn more about R's interaction plots and Johnson-Neyman plots which may help to interpret said interactions. The latter are very hard to make in SAS.

9f

```
auto.fit3 <- lm(mpg~log(weight)+sqrt(displacement)+I(horsepower^2), data =</pre>

```

The log weight of a car and the square root of its displacement have a statistically significant relationship with MPG. Horsepower^2 is not statistically associated with MPG.

This model, however, does not seem to out perform the original in terms of variance explained (as determined by the smaller RSS)

15

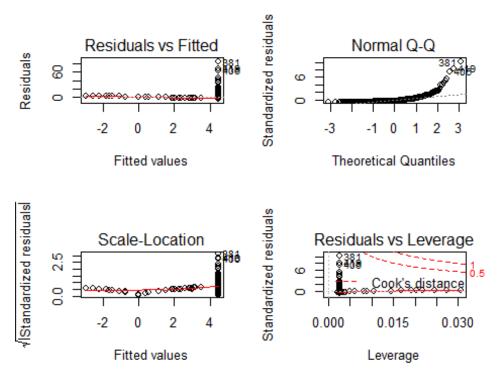

Please forgive the clumsy approach to question 15. I am new to r.

## Signif. codes:
##
## Residual standard error: 6.569 on 502 degrees of freedom
## Multiple R-squared: 0.4202, Adjusted R-squared: 0.4167
## F-statistic: 121.3 on 3 and 502 DF, p-value: < 2.2e-16
```

Results:

- 1. ZN: significant linear and quadratic association.
- 2. Indus: linear, quadratic and cubic.
- 3. Nox: linear, quadratic and cubic.
- 4. Rm: linear and quadratic.

- 5. Dis: linear, quadratic and cubic.
- 6. Rad: linear and quadratic.
- 7. Tax: linear and quadratic.
- 8. Ptratio: linear, quadratic and cubic.
- 9. Black: linear only.
- 10. Lstat: linear and quadratic.
- 11. Medv: linear, quadratic and cubic.

mean(knn22 != ctest$c01)
## [1] 0.05940594
knn23 <- knn(train.x2, test.x2, ctrain$c01, k=10)
mean(knn23 != ctest$c01)
## [1] 0.05940594
knn24 <- knn(train.x2, test.x2, ctrain$c01, k=25)
mean(knn24 != ctest$c01)
## [1] 0.0990099
knn25 <- knn(train.x2, test.x2, ctrain$c01, k=50)
mean(knn25 != ctest$c01)
## [1] 0.2673267
knn26 <- knn(train.x2, test.x2, ctrain$c01, k=150)</pre>
mean(knn26 != ctest$c01)
## [1] 0.2475248
```

- 1. k=1 through k=10 produce the same error rate: 5.94%.
- 2. k=25 has an error rate of 9.9%
- 3. k=50 27.72% error rate
- 4. k=150 24.75%

In this case, selecting only the most correlated variables with out outcome produces models with less error when k<25 vis-a-vis clustering using all provided variables.
